

A Grave Challenge of Internet Piracy

*Soroush Razmjooi

There has been always barriers and problems caused by different reasons in the world of business. Internet has a very significant role in today's trade activities. Many companies use the option e-commerce as the only way of doing business or one of the ways. As the use of e-commerce grows, so do the barriers and problems within e-commerce. The issue of trust and security is a very discussed, important and unsolved factor in e-commerce. Many, both private and entrepreneurial, consummates do not feel either secured or assured by doing business or personal purchase within e-commerce. This lack of trust and security brings some serious barriers in e-commerce, which should be seriously considered. Security and trust issues could be found both within companies that engaged with small businesses and companies doing broader businesses. Web sites are being created by using the HTML code of the Web sites that are legitimate. By doing this the criminals manage to create a site that exactly looks like the legitimate businesses' site. Further the author means that the criminals could misuse the consumers of that Web site by different ways, like sending them e-mails with false information in order to gain consumers' personal information. He means that the whole process could end up with criminals tricking the consumers and get access to their financial accounts and so on. There is a lot of risk in using, accessing the internet from once computer from a minimal virus attack to loss of balance from the bank accounts. Though, the companies inventing software guarantee the quality and security of the software for the users, there is always a risk of piracy of the same copies.
